Product Description

The **ZR-96 DNA Sequencing Clean-up Kit™** provides a simple method for the rapid removal of post-cycle sequencing reaction contaminants (i.e., unincorporated fluorescent dyes, residual salts, dNTPs, primers, and enzymes) from DNA extension products. These contaminants can often interfere with the quality and signal strength of sequencing data. In particular, unincorporated dyes can result in dye peaks (“dye blobs”) which may obscure portions of the sequencing chromatogram and interfere with base-calling accuracy of sequencing analysis software.

The **ZR-96 DNA Sequencing Clean-up Kit™** employs a single-buffer system that allows for efficient DNA adsorption onto the matrix of the supplied **Zymo-Spin™ IB-96 Plate**. The DNA is washed then eluted with a small volume of water or loading dye containing formamide. The entire DNA purification procedure typically takes about 10 minutes.

Sequencing chromatogram of pGEM® DNA generated using an ABI 3730xl DNA analyzer. DNA was labeled with ABI BigDye v3.1 terminators and cleaned using the ZR DNA Sequencing Clean-up Kit™.

Protocol

1. Add 240 μ l of **Sequencing Binding Buffer** to 5-20 μ l sequencing reaction.
2. Transfer mixture to a provided **Zymo-Spin™ IB-96 Plate** mounted onto a **Collection Plate**.
3. Centrifuge at 4,000 - 7,000 rpm (2850 - 8720 x g) for 2 minutes.
4. Add 300 μ l **Sequencing Wash Buffer** to each well of the plate. Centrifuge at 4,000 - 7,000 rpm (2850 - 8720 x g) for 5 minutes.
5. Add 15-20 μ l water directly to the column matrix of the filter plate. Place the **Zymo-Spin™ IB-96 Plate** on top of the supplied **96-Well PCR Plate** and mount the assembly onto the **Collection Plate**, then centrifuge at 4,000 - 7,000 rpm (2850 - 8720 x g) for 2 minutes to elute the DNA.

Note: A formamide solution (\leq 20%) may also be used to elute the DNA.

Ultra-pure DNA is now ready to be loaded into the sequencer.

Procedure For Filter Plate Re-generation

(**Note:** Plates may be regenerated up to 10X pending no damage to the plates or matrices. If plates are regenerated, additional buffers will have to be ordered separately.)

1. Add 500 μ l of 0.1% HCl to each well of the filter plate or submerge the whole plate in 0.1% HCl solution and incubate at room temperature for 30 minutes.
2. Centrifuge at 4,000 - 7,000 rpm (2850 - 8720 x g) for 5 minutes.
3. Let dry overnight at 37 °C.
4. Filter plates are now ready for use.
