

# INSTRUCTION MANUAL

# OneStep qMethyl™ Kit

Catalog No. D5310

## **Highlights**

- Single step, real-time PCR procedure for bisulfite-free determination of DNA methylation status.
- Includes reagents and controls for quantitative detection and reliable performance.
- Ideal for rapid screening of single- and multi-locus DNA methylation.

## **Contents**

Note - Integrity of kit components is guaranteed for up to one year from date of purchase. Reagents are routinely tested on a lot-to-lot basis to ensure they provide the highest performance and reliability.

The PreMixes in this kit contain SYTO 9<sup>®</sup> dye for analysis using real-time PCR. However, the **OneStep qMethyl™-Lite** product (Cat. No. D5311) omits this dye. The "Lite" version allows real-time PCR to be performed with other fluorescent dyes or molecular probes of the researcher's choosing.

Some technologies of the *OneStep* qMethyl™ Kit are patent pending.

Use of SYTO® 9 is provided under an agreement between Life Technologies Corporation (Molecular Probes Labeling and Detection Technologies) and Zymo Research Corporation and the manufacture, use, sale or import of this product is subject to one or more U.S. Patents and corresponding international equivalents. For information on purchasing a license to this product for purposes other than research, contact Life Technologies Corporation (Molecular Probes Labeling and Detection Technologies), Business Development, 29851 Willow Creek Road, Eugene, OR 97402. Tel: (541) 465-8300, Fax: (541) 335-0354. SYBRgreen® is a registered trademark of Life Technologies Corporation.

The Polymerase Chain Reaction (PCR) process is covered by U.S. Pat. Nos. 4,683,195 and 4,683,202 assigned to Hoffmann-La Roche. Patents pending in other countries. No license under these patents to use the PCR process is conveyed expressly or by implication to the purchaser by the purchase of Zymo Research's *OneStep* qMethyl™ Kit. Further information on purchasing licenses to practice the PCR process can be obtained from the director of Licensing at Applied Biosystems, 850 Lincoln Centre Drive, Foster City, California 94404 or at Roche Molecular Systems, Inc., 1145 Atlantic Avenue, Alameda, California 94501.

Note - TM Trademarks of Zymo Research Corporation. This product is for research use only and should only be used by trained professionals. It is not intended for use in diagnostic procedures. Some reagents included with this kit are irritants. Wear protective gloves and eye protection. Follow the safety guidelines and rules enacted by your research institution or facility.

<sup>\*</sup> Store the Test Reaction PreMix and the Reference Reaction PreMix at -20°C (-80°C for long-term storage) upon arrival.

## Introduction

Epigenetic modifications are regarded as fundamental to the regulation of gene expression. DNA methylation is one such modification that plays crucial roles in widespread biological phenomena including the regulation of gene activity, gene imprinting, embryonic development and X-chromosome inactivation in higher organisms. Current methods used to evaluate DNA methylation including bisulfite sequencing, Methylation Specific PCR (MSP), HPLC and Methylated DNA Immunoprecipitation (MeDIP) have proven too costly, time consuming, or inappropriate for the investigation of large numbers of loci. The *OneStep* qMethyl<sup>TM</sup> Kit from Zymo Research provides a simple, straightforward, and bisulfite-free procedure for rapid, locus-specific DNA methylation assessment. Simply add DNA into the appropriate reaction mix then quantitate via real-time PCR... *OneStep!* 

For **Assistance**, please contact Zymo Research Technical Support at 1-888-882-9682 or e-mail tech@zymoresearch.com.

Zymo Research also offers technologies for high resolution genome-wide analysis of DNA methylation. Please visit our website for detailed information

**Add DNA** 

**Real-time PCR** 

Simple, One Step DNA Methylation Determination

Unlike conventional qAMP procedures that contain multiple steps, the *OneStep* qMethyl™ method integrates the workflow into a simple, single step reaction. This minimizes errors that can occur during setup and the likelihood of contamination while allowing for rapid and accurate DNA methylation level detection.

## **Overview of Procedure**

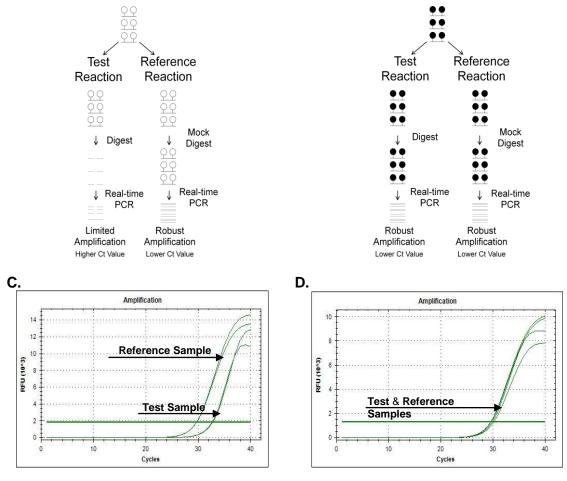

Non-methylated DNA Input

A.

The *OneStep* qMethyl™ Kit is used for the detection of locus-specific DNA methylation via the selective amplification of a methylated region of DNA. This is accomplished by splitting any DNA to be tested into two parts: a "Test Reaction" and a "Reference Reaction" (see Figure 1 below). DNA in the Test Reaction is digested with Methylation Sensitive Restriction Enzymes (MSREs) while DNA in the Reference Reaction is not. The DNA from both samples is then amplified using real-time PCR in the presence of SYTO® 9 fluorescent dye and then quantitated. Cycle threshold (Ct) values for Test and Reference DNA samples will vary depending on methylation status, with large Ct differences most characteristic of non-methylated DNA.

B.

Methylated DNA Input

**Figure 1.** Schematics A and B (above) illustrate the sample workflow of Non-methylated DNA and Methylated DNAs. In both cases the DNA is divided in two parts; a **Test Reaction** and a **Reference Reaction**. **Test Reaction** samples are MSRE digested while the **Reference Reaction** samples are not (mock digested). Following digestion, DNA from both samples is used for real-time PCR. The white lollipops in the image represent unmethylated cytosines and black lollipops methylated cytosines in CpG dinucleotide context.

Following real-time PCR, amplification plots (C and D) demonstrate non-methylated DNA exhibits large differences in the Ct values for **Test** and **Reference Reactions** (C) while highly methylated DNA samples exhibit little difference (D). These data are used as the basis for methylation determination as detailed on page 7.

## **Considerations for Experimental Design**

### A. DNA Quality

Input DNA processed using the *OneStep* qMethyl<sup>™</sup> procedure should be high quality and suitable for use in restriction enzyme (i.e., MSRE) digestion. If input sample purity is in question, it is recommended to use the **Genomic DNA Clean & Concentrator** <sup>™</sup> (Cat. Nos. D4010, D4011, Zymo Research Corp.) for quick cleanup of input DNA.

#### **B.** Input DNA and Reaction Volume

Each reaction mixture for the *OneStep* qMethyl™ procedure (page 5) is optimized for 20 ng input DNA. For each sample, 5 μl DNA (4 ng/μl) should be added to bring the final reaction volume to 20 μl (i.e., 1 ng/μl final concentration). Input DNA should be diluted in water or "modified" TE containing a low concentration of EDTA (see sidebar).

"Modified" TE Buffer: (10 mM Tris pH 8.0-8.5. 0.1 mM EDTA)

### C. Duplicate Sampling

Precise Ct value determination is critical for accurate quantification of DNA methylation by real-time PCR using the *OneStep* qMethyl™ procedure. Therefore, it is recommended to set up each Test Reaction and Reference Reaction measurement in duplicate to ensure accurate, non-biased data collection.

#### D. Primer Design and PCR Amplicons

Primers should span a DNA locus (region) that is 120 bp to 350 bp and contains <u>at least</u> two (2) MSRE sites. See **Appendix I** (page 8) for a list of the MSREs featured in the **OneStep qMethyl™ Kit**. Primers can be designed using conventional procedures.

#### E. Human Methylated & Non-methylated DNA Standards

It is critical to include the **Human Methylated & Non-methylated DNA Standards** (in duplicate) with the control MGMT primers to validate the accuracy of the **OneStep qMethyl**<sup>TM</sup> procedure for determining methylation percentage.

## **Protocol**

The following protocol illustrates the use of the *OneStep* qMethyl™ procedure for DNA methylation detection at a single-locus¹. This allows for the processing of up to 22 DNA samples (in duplicate)² using a 96-well real-time PCR plate. The provided **Human Methylated & Non-methylated DNA Standards**³ should be processed along with the samples for the purpose of validating the combined MSRE digestion/real-time PCR step (see **Appendix III**, page 10). The following should serve as a <u>guideline</u> when setting up your own experiment. The format is also compatible with thin-walled PCR tubes and tube strips.

- I. Preparation of Test Reaction and Reference Reaction Mixtures<sup>4</sup>.
  - 1. For each DNA sample (and Standard) to be analyzed, setup (on ice) both a **Test Reaction** and a **Reference Reaction** mixture.

#### Test Reaction (per well)

| 10 µl       | 2X Test Reaction PreMix (contains MSREs)               |
|-------------|--|
| 1 µl        | 10 μM <b>Forward Primer</b> (or <b>MGMT Primer I</b> ) |
| 1 µl        | 10 µM Reverse Primer (or MGMT Primer II)               |
| <u>3</u> µl | DNase/RNase-free Water                                 |
| 15 ul       | Total Volume   |

#### Reference Reaction (per well)

| 10 µl | 2X Reference Reaction PreMix                                  |
|-------|---|
| 1 µl  | 10 μM <b>Forward Primer</b> ( <u>or</u> <i>MGMT</i> Primer I) |
| 1 µl  | 10 μM Reverse Primer (or MGMT Primer II)                      |
| 3 µl  | DNase/RNase-free Water  |
| 15 ul | Total Volume  |

Make a **Test** and **Reference Reaction** master mix to accommodate the 22 DNA samples and the **Methylated & Non-methylated DNA Standards**. Add 15  $\mu$ I of **Test** and **Reference Reaction** master mix to the wells of a 96-well real-time PCR plate (not provided) according to the diagram below.

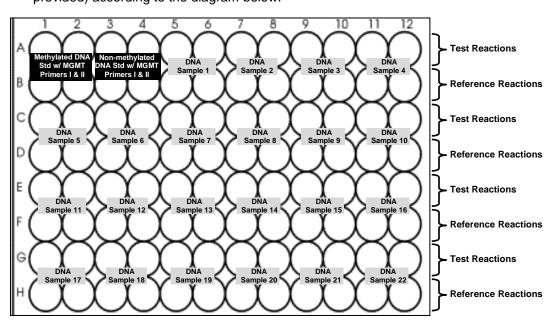

#### Notes:

<sup>1</sup>See Appendix II to use the OneStep qMethyl™-PCR procedure for simultaneous methylation level determination in multiple loci.

<sup>2</sup>Alternatively, if not performed in duplicate, 44 individual DNA samples can be processed.

<sup>3</sup>Enough of the Human Methylated & Nonmethylated DNA Standards is provided for a <u>single run</u>, 96-well analysis.

<sup>4</sup>The final concentration of MgCl₂ and primers in Reference Reaction & Test Reaction mixtures should be 3.75 mM and 500 nM, respectively.

- 2. Add 5  $\mu$ l (20 ng) of the appropriate DNA sample to those designated wells (*in duplicate*) as shown in the diagram.
- 3. Seal the plate with sealing tape or a similar device<sup>1</sup>. Transfer to a 96-well real-time PCR instrument (e.g., Applied Biosystems 7500 Series, Roche LightCycler<sup>™</sup>, Bio-Rad CFX96<sup>™</sup>, illumina Eco<sup>™</sup> Real-Time PCR System, or similar). Proceed with Step II below.

## II. Coupled MSRE Digestion/Real-Time PCR

Reaction conditions for the combined MSRE Digestion/Real-Time PCR processes have been optimized for direct input, digestion, and real-time amplification of DNA samples. However, annealing temperature and elongation time may need to be optimized depending on the design of the primers. The parameters below are for the supplied *MGMT*<sup>2</sup> primers and should be used as a <u>guideline</u> when setting up your own experiment. Typically, between 35-40 cycles is recommended for the amplification of most DNA templates.

1. Set the real-time PCR instrument to excitation and emission wavelengths of (~) **465 nm** and **510 nm**, respectively.

Note: a setting that is compatible with SYBRgreen® should be compatible with the SYTO 9® dye in this kit.

2. Perform real-time PCR using the following parameters.

|                                    | <u>Temperature</u>     | <u>Time</u>                        |
|------------------------------------|------------------------|------------------------------------|
| MSRE Digestion*                    | 37°C                   | 2 hours                            |
| Initial Denaturation               | 95°C                   | 10 minutes                         |
| Denaturation Annealing** Extension | 94.5°C<br>54°C<br>72°C | 30 seconds 60 seconds 35-40 cycles |
| Final Extension<br>Hold            | 72°C<br>4°C            | 7 minutes > 5 minutes              |

<sup>\*</sup> If necessary, the MSRE Digestion can be performed at 37°C using an incubator or similar device.

#### Notes:

<sup>1</sup>To eliminate bubbles that may be present within the wells, spin down the plate prior to conducting real-time PCR (Step II).

<sup>2</sup>Refer to **Appendix III** for detailed information regarding the **Methylated** and **Non-methylated Human DNA Standard** and **MGMT** primers.

<sup>\*\*</sup>The annealing temperature and extension time with may vary with user designed primers and the size of the amplicon. Therefore, it may be necessary to adjust and optimize these conditions.

## III. Data Analysis<sup>1</sup>

The methylation level for any amplified locus (region) can be determined using the following equation:

Percent Methylation = 
$$100 \times 2^{-\Delta Ct}$$

where  $\Delta Ct$  = the average Ct value from the **Test Reaction** minus the average Ct values from the **Reference Reaction** 

#### Example:

The table (below) represents actual real-time PCR data from the *OneStep* **qMethyl**<sup>™</sup> procedure using the **Human Non-methylated DNA Standard** and *MGMT* primers (performed in duplicate).

| Ct values of <b>Test Reaction</b> | Ct values of Reference Reaction |
|-----------------------------------|---------------------------------|
| 33.83                             | 29.76                           |
| 33.81                             | 29.81                           |

To determine the methylation level of the Human Non-methylated DNA standard,

1. Calculate the average Ct values for **Test** and **Reference Reactions**.

| Average Ct value of <b>Test Reaction</b> | Average Ct value of <b>Reference Reaction</b> |  |
|--|---|--|
| 33.82                                    | 29.79   |  |

2. Determine the  $\Delta$ Ct by subtracting the average Ct value of **Test Reaction** from the average Ct value of **Reference Reaction**.

$$\Delta Ct = 33.82 - 29.79 = 4.03$$

3. Substitute the  $\Delta$ Ct value into the equation: 100 x 2<sup>- $\Delta$ Ct</sup>

$$100 \times 2^{-4.03} = 6\%$$

Using this equation, the methylation level of the **Human Non-methylated DNA Standard** is determined to be  $\underline{6\%}$  at the locus spanned by the *MGMT* primers. The actual value is ~5% as determined by bisulfite sequencing methods (**Appendix III**).

#### Note:

www.zymoresearch.com/ qmethylcalc

## Appendix I Methylation Sensitive Restriction Enzymes (MSREs) Featured in the OneStep qMethyl<sup>TM</sup> Procedure

It is important to consider the consensus sequences of those MSREs (below) when designing primers to any particular DNA locus, since any particular locus should contain <u>at least</u> two (2) MSRE sites for accurate methylation assessment using the *OneStep* qMethyl™ procedure.

A mix of the following MSREs are present in the **Test Reaction Premix**:

# <u>Appendix II</u> Using the *OneStep* qMethyl™ Procedure for Methylation Level Detection for Multiple Loci

The protocol on page 5 illustrates the use of the *OneStep* qMethyl™ procedure for the evaluation of methylation levels within a *single locus* from multiple DNA samples. However, methylation determination within *multiple loci* of a particular DNA sample is often required. For methylation assessment of 22 different loci in a DNA sample, the following example is provided.

1. For each locus to be analyzed, setup (on ice) both a **Test Reaction** and **Reference Reaction** mixture.

Test Reaction (per well)

- 10 μl **2X Test Reaction PreMix** (contains MSREs)
- 5 μl DNA (or **Methylated & Non-methylated DNA Standard**) (4 ng/μl)
- 3 µl DNase/RNase-free Water
- 18 µl Total Volume

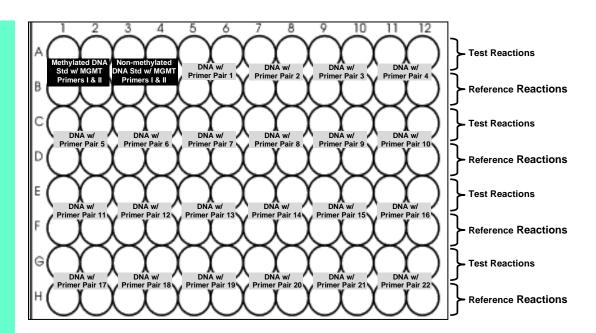

Reference Reaction (per well)

- 10 µl 2X Reference Reaction PreMix (contains MSREs)
- 5 μl DNA (or Methylated & Non-methylated DNA Standard) (4 ng/μl)
- 3 µl DNase/RNase-free Water
- 18 µl Total Volume

Make a **Test** and **Reference Reaction** master mix to accommodate duplicate sampling of 22 samples and the **Methylated & Non-methylated DNA Standards**. Add 18 μl of **Test** and **Reference Reaction** master mix to the wells of a 96-well real-time PCR plate according to the diagram on the following page.

#### Notes:

<sup>1</sup>The final concentration of MgCl<sub>2</sub> and primers in Reference Reaction & Test Reaction mixtures should be 3.75 mM and 500 nM, respectively.

2. Dilute primers to a final concentration of 10  $\mu$ M in **DNase/RNase-free Water** and then add 2  $\mu$ I of the appropriate primers (pre-mixed) to those designated wells (*in duplicate*) as shown in the diagram. Continue with Step 3 in the standard protocol (page 6).

## <u>Appendix III</u> The Human Methylated & Non-methylated DNA Standards and <u>MGMT</u> Primer Set

This kit contains **Human Methylated DNA & Non-methylated DNA Standards** with an *MGMT* primer set for validating the *OneStep* **qMethyl™** system. Enough material is provided for a single run, 96-well analysis. The **Human Methylated DNA** has been enzymatically methylated at all cytosine positions comprising CG dinucleotides using M.Sss I methyltransferase. The **Human Non-methylated DNA** was purified from cells containing genetic knockouts of both DNMT1 and DNMT3b DNA methyltransferases and has a low level of DNA methylation (<5%).

### **Product Specifications**

## I. Human Non-Methylated DNA Standard

Source: DNA purified from HCT116 DKO cells [DNMT1 (-/-) / DNMT3b (-/-)]. Concentration: 4 ng/µl in buffer (10 mM Tris-HCl, 1 mM EDTA, pH 8.0)

Storage: -20 °C

## II. Human Methylated DNA Standard

Source: DNA purified from HCT116 DKO cells [enzymatically methylated by

M.Sssl Methyltransferase (EC 2.1.1.37)].

Concentration: 4 ng/µl in buffer (10 mM Tris-HCl, 1 mM EDTA, pH 8.0)

Storage: -20 °C

#### III. MGMT Primers Set

Concentration: 10 µM in TE buffer (10 mM Tris-HCl, 1 mM EDTA, pH 8.0)

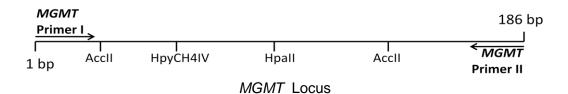

Volume: 20 µl of each primer

Storage: -20 °C

MGMT Primer I: 5' - GGT GTG AAA ACT TTG AAG GA - 3'
MGMT Primer II: 5' - CAC TAT TCA AAT TCC AAC CC - 3'

IV. The expected amplicon for the Human Methylated & Non-methylated DNA Standard with MGMT I & II primers (underlined) is 186 bp and contains four (4) MSRE sites (see sequence and diagram below).
